TECHNOLOGY TIMES

"Insider Tips To Make Your Business Run Faster, Easier And More Profitably"

What's New

I just attended a short conference of my professional association, ASCII. I met many of my peers to talk shop and learn from them. I met vendors who sell and support my "tools of the trade" and listened to educational seminars on current topics such as security and Cloud technology.

There's always lots of new stuff, but unless I see something compelling, I tend to stick with what works. I'm a big believer in continuity!

Our Mission: To help clients STEP over the HILLs of technology, by providing responsive Support and reliable, functional small business computer systems.

The ONE Thing You Must Do to Keep Your Data Safe in the Cloud

Is Your IT Guy Doing This?

How secure is your data? Cloud data storage is becoming a massive industry in this country, and many businesses and other institutions are putting their data into the cloud. Some of this data is pretty harmless. Other stuff — like hospital records, banking information, or company payrolls — are prime targets for bad actors. Is the cloud storage tradeoff worth it?

The short answer is yes, but only if your IT guy is encrypting your sensitive data.

Every cloud storage company you talk to will claim to take top-of-theline security measures on behalf of your data. But that, in a nutshell, highlights the problem with cloud storage. Your data is entrusted to a third party for safekeeping. It's possible that they'd do everything in their power to safeguard your information. But bad things, like ransomware, phishing, or just plain going out of business, do happen. And when they happen, it's not the cloud storage company whose data is on the line; it's yours.

Even if that doesn't occur, let's be honest. Most of the major cloud storage companies are based in the United States, the U.K., or France, where they could be subject to NSA snooping (or questionably legal surveillance from any other government entity). Despite the best efforts of many storage companies to prevent

government intrusion, your data could still be at risk, even when it's locked up tight.

This brings us back to encryption, which is the hands-down best way to protect your data, period. It's just like locking sensitive data in a box, with a password needed to reopen it. Even if

someone gets ahold of the box, if they don't have the password, there's nothing they can do with it. There are a lot of encryption tools out there and you'll want to make sure that you have the right one for your specific needs. If you ever need a recommendation, don't hesitate to reach out and ask! We'll be happy to provide you with the specific recommendation (free or paid) that fits your needs.

In addition, most cloud storage companies protect your data with their own encryption, but this isn't as secure as encrypting your own information. That's because the cloud storage company has the encrypted data in its possession, but it also has the keys to that data. If someone can get in, they can probably get the information they want. And a disgruntled employee — or just a hapless one — can also provide hackers access to the system through good old-fashioned human engineering.

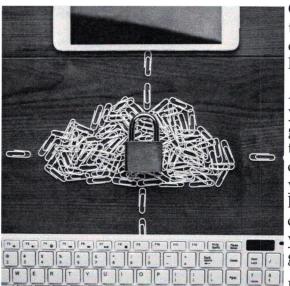

If the cloud storage company is compromised (and it happens quite often), will your data be secured or unsecured? Well, if you're encrypting your own data before uploading it, then the bad actors will open up the safe to find ... a bunch of locked boxes. Pretty frustrating, right?

On the other hand, if you've trusted the cloud storage company to take care of everything, you're going to have a bad day.

As you can tell, it makes sense to have your IT guy encrypt everything that gets put on the cloud before it gets there. But remember, just as your cloud storage provider is vulnerable, you can be vulnerable as well. It's less likely that bad actors will target your company specifically, but if they want your data bad enough, they'll go to great lengths to get it.

Many people have a misconception that these criminals will just use a

magic program to crack your encrypted files. Decryption does exist, but it requires a lot of time and processing power. It's far more likely that hackers will target your email or other aspects of your system and try to find out the encryption codes that way. And never forget that people are the weakest part of your IT security. Educate employees so they aren't vulnerable to phishing scams, downloading questionable software, and visiting the wrong websites.

Geoff Smart: 3 Ways to Get Your Life Back

I was once meeting with an executive, and I noticed a small framed sign on her desk that read, *Eat Lunch*. When I asked about it, she said, "My job is all-consuming. If I am ever able to eat lunch, I'll know that I got my life back." Sound familiar? So many of us are capable business leaders and yet powerless to reclaim our lives from our jobs. But work is not supposed to be like that. And, if yours is, you need to do all three of the things I've listed below. Sorry, but to really get your life back, you have to do them all.

many nights per week you want to eat dinner with your family. Setting and tracking goals works. A CEO of a \$20 billion company set a goal to be home from 6–8 p.m. (to spend time with his teenager) at least four nights a week, and he often beat that goal. An extremely busy tech entrepreneur set a goal to have a proper cellphones-off, two-week vacation every summer. An executive assistant in our New York office always wanted to coach her daughter's soccer team, so she finally set the goal and did it.

Second, schedule personal time. I recently called a colleague at midday on a Thursday. He was at the zoo with his wife and two kids. We have a "freedom and flexibility" culture at ghSMART. If somebody is trying to schedule your time over one of your personal commitments, tell them you are not available. It's none of their business why you are not available. It's not either-or. You can be successful and have a life.

Third, delete, delegate, delay, and then (as a last resort) do. I saved the best tactic for last. Is your first instinct to do whatever the urgent,

flashing, text-chiming, inbox pop-up task demands? That's a lousy way to work, and it's no way to live your life. Follow this sequence instead:

- Your first instinct should be to delete any task. Sorry, task! You don't own me.
- If it has to get done, **delegate** it to a capable person who can do it.
- If there is nobody to delegate it to, then delay the task until a time that works for you.
- If that is not practical, then your last resort is to **do** that task now.

If you set personal goals, schedule personal time, and practice the delete-delegate-delay-do framework, you will find you can achieve career success and get your life back. And if you think these tactics are useful, please download our other free leadership tools at geoffsmart.com/smarttools

best-selling author.

■ The Shocking Secret About Bank Fraud That Practically No Small Business Owner Knows, **But Should.** Did you know your COMPANY'S bank account doesn't enjoy the same protections as a personal bank account? For example, if a hacker takes money from your business account, the bank is NOT responsible for getting your money back. (Don't believe me? Go ask your bank what their policy is on refunding money stolen from your account!) Many people think FDIC protects you from fraud, but it doesn't. It protects you from bank insolvency, NOT fraud. Here's a quick tip: Set up email alerts on your account so you are notified any time money is withdrawn. The FASTER you catch fraudulent activity, the better your chances are of keeping your money. If you contact the bank

IMMEDIATELY, you have a very high probability of foiling a hacker's attack. *Oct.* 28, 2016

WITHOUT Leaving the Comfort of Home. Glasses company Warby Parker is making the jump from mail order to medical diagnoses with their new Prescription Check app, which lets you test your eyes at home. Of course, some restrictions apply — like being a Warby Parker customer, living in a handful of participating states, having no history of eye disease, having received a real eye exam

"Gentlemen! What say we stop all this bickering and simply make it a dog eat cat world!"

in the last five years ... you get the idea. Still, it's a very cool idea and perhaps a herald of things to come in the world of remote medicine. engadget.com May 23, 2017

How to Buy a Secondhand **Smartphone WITHOUT Getting** Ripped Off. There are great deals to be had on used electronics, but there are also pitfalls. Our advice? Start by being realistic, do plenty of research on real-world prices and conditions using sites like eBay, and buy immediately after the holiday season or when a new version of what you want comes out. As for those pesky scams, it's much harder to "pull the wool" in person, so use Craigslist and follow their safety guidelines for great deals. gizmodo.com May 11, 2017

Can a Surgeon Really Use an App to Practice Surgery? Touch Surgery is an app that lets anybody "operate" in dozens of realistic surgery simulations. Around the world, there are plenty of places with just one or two doctors within driving distance, and those physicians have to undertake procedures they may not be trained for. A few hours with Touch Surgery on the smartphone - or, for added realism, the Hololens - can mean the difference between a bad outcome and a good recovery for the patient. digitaltrends.com April 14, 2017
